Résumé

Some of the potential questions that can be addressed in this discussion are: - How can we define the user community's needs in terms of data sharing?
- How can services be defined to meet these needs?
- These questions have been addressed for several years within the framework of several European EOSC projects. What are the prospects for a more global vision (within the framework of OSCARS?) and what are the short- and medium-term developments?
- How can users be supported to develop/generalize the use of these services? And how can these services be developed (continuous improvement)?
- How should the structure be organized? What is the current or potential role for French institutions?
